## S1 Correlation of $\boldsymbol{r} \mathbf{m м}^{\prime}$ with $\boldsymbol{\theta}^{\text {мом' }}$.

As can be seen from Figure S1, we observe a very strong quadratic correlation of $r_{\mathrm{Mm}^{\prime}}$ with $\theta_{\mathrm{MOM}}$, such that $R^{2}$ is almost unity and the root mean square deviation in the predicted angle is less than $0.08^{\circ}$. [Note that values of $r_{\text {MM }^{\prime}}$ and $\theta_{\text {мом }}$ are used here with more decimal places than are quoted in Table 1.] The underlying reason for this very strong quadratic correlation is likely to be trigonometric identities that apply to such an orthodiagonal quadrilateral (namely a kite).

Figure S1. Correlation of $r_{\mathrm{MM}^{\prime}}$ with $\theta_{\mathrm{MOM}^{\prime}}$ for the $\mathrm{MM}^{\prime} \mathrm{O}_{2}$ clusters. The dotted curve is a quadratic.

## S2 Results of additional energy calculations and geometry optimizations.

Table S1. Dissociation energies to metal oxide monomers calculated at the all electron CCSD/cc-pVTZ optimized geometries using frozen core $\operatorname{CCSD}(\mathrm{T}) / \mathrm{cc}-\mathrm{pVQZ}$. See also Table 2.

|  | $D_{\mathrm{e}}(\mathrm{kcal} / \mathrm{mol})$ |
| :--- | :---: |
| $\mathrm{Be}_{2} \mathrm{O}_{2}$ | 163 |
| $\mathrm{BeMgO}_{2}$ | 152 |
| $\mathrm{Mg}_{2} \mathrm{O}_{2}$ | 130 |
| $\mathrm{MgCaO}_{2}$ | 127 |
| $\mathrm{Ca}_{2} \mathrm{O}_{2}$ | 121 |
| $\mathrm{BeCaO}_{2}$ | 157 |

Table S2 Results of additional geometry optimizations for $\mathrm{MM}^{\prime} \mathrm{O}_{2}$ clusters, including dissociation energies to metal oxide monomers.
(a) B3LYP/cc-pVTZ

| M | $\mathrm{M}^{\prime}$ | $r_{\mathrm{MM}^{\prime}}(\AA)$ | $\theta_{\mathrm{MOM}^{\prime}}\left({ }^{\circ}\right)$ | $D_{\mathrm{e}}(\mathrm{kcal} / \mathrm{mol})$ |
| :--- | :--- | :---: | :---: | :---: |

## S6 Results from a heuristic 3c generalization of Cioslowski's covalent bond order.

In order to get more insight into the parentage of the weak 3c bonding, especially that in the $\sigma$ system, we use a heuristic 3c generalization [23] of Cioslowski's covalent bond order [48], beyond the scope of traditional 2c-2e bonding. This straightforward generalization to three centers takes the simple form [23]:

$$
\begin{equation*}
\mathcal{C}(A, B, C)=3!\sum_{i} v_{i}^{3}\left\langle\lambda_{i} \mid \lambda_{i}\right\rangle_{\Omega_{A}}\left\langle\lambda_{i} \mid \lambda_{i}\right\rangle_{\Omega_{B}}\left\langle\lambda_{i} \mid \lambda_{i}\right\rangle_{\Omega_{C}} \tag{S1}
\end{equation*}
$$

in which the $\lambda_{i}$ are again the LNOs with populations $v_{i}$ that result from isopycnic localization [26] of the CCSD/cc-pVTZ natural orbitals. A particularly useful feature of such a definition is that, in contrast to the Wiberg-Mayer-like bond orders that we have used, the values of $\mathcal{C}(A, B, C)$ can be
unambiguously decomposed into contributions associated with individual LNOs. The results of such a decomposition for each of the clusters (see Table S4) clearly show that the dominant component of the weak 3 c bonding in the $\mathrm{MOM}^{\prime}$ moieties is consistently attributed to the contributions of adjacent metal-oxygen $\sigma$ bonds. There are smaller contributions in each case from the distorted $\mathrm{O}\left(2 \mathrm{p}_{\pi}\right)$ LNO, with the contribution of the distorted $\mathrm{O}\left(2 \mathrm{~s}^{2}\right)$ quasi-lone pair being practically marginal. It follows that the indirect $\mathrm{MM}^{\prime}$ interactions in each $\mathrm{MOM}^{\prime}$ moiety arise primarily from the electron 'pairs' of adjacent metal-oxygen $\sigma$ bonds with a smaller additional contribution from the $\mathrm{O}\left(2 \mathrm{p}_{\pi}\right)$ electron pair that is deformed towards M and $\mathrm{M}^{\prime}$. This corroborates the classification of the weak 3 c MOM' interactions as predominantly $3 \mathrm{c}-4 \mathrm{e} \sigma$ bonding augmented by a smaller component due to $3 \mathrm{c}-2 \mathrm{e} \pi$ bonding.

Table S 4 . Relative contributions to the values of $\mathcal{C}\left(\mathrm{M}, \mathrm{O}, \mathrm{M}^{\prime}\right)$ (see Equation S 1 ) for $\mathrm{MM}^{\prime} \mathrm{O}_{2}$ clusters from terms involving individual LNOs.

| M | $\mathrm{M}^{\prime}$ | $\sigma(\mathrm{M}-\mathrm{O})$ | $\sigma\left(\mathrm{M}^{\prime}-\mathrm{O}\right)$ | $\mathrm{O}\left(2 \mathrm{p}_{\pi}\right)$ | others |
| :--- | :--- | :---: | :---: | :---: | :---: |
| Be | Be | $41 \%$ | $41 \%$ | $16 \%$ | $2 \%$ |
| Be | Mg | $30 \%$ | $54 \%$ | $15 \%$ | $1 \%$ |
| Mg | Mg | $42 \%$ | $42 \%$ | $14 \%$ | $1 \%$ |
| Mg | Ca | $46 \%$ | $34 \%$ | $19 \%$ | $1 \%$ |
| Ca | Ca | $38 \%$ | $38 \%$ | $24 \%$ | $1 \%$ |
| Be | Ca | $33 \%$ | $45 \%$ | $21 \%$ | $1 \%$ |
