Educating Young People About Vulnerability to Sexual Exploitation: Safeguarding Practitioners' Standpoints at the Intersections of Gender, Sexuality and Risk

Abstract: This article discusses findings from a qualitative study designed to evaluate the effectiveness of a Child Sexual Exploitation (CSE) awareness raising programme targeted at young people. Drawing on data from in-depth interviews with practitioners involved in a multi-agency team established to reduce vulnerability to CSE, we elucidate that, in addition to being directed by professional codes, practitioner perceptions and judgments were also influenced by gendered assumptions and underlying anxieties about childhood sexuality. The empirical data presented suggests that attitudes toward young people and intervention decisions are partially steered by cultural values which connect not only to personal morals, but also influence decisions made in conjunction with professional risk analytic frameworks. Our analysis indicates that broader investigation of the commingling of personal and professional values in safeguarding contexts is required, alongside the creation of protected spaces for professional reflection and dialogue amongst practitioners to support decision making.

Key Words: Child Sexual Exploitation, Practitioner Perceptions, Risk, Safeguarding, Young People.

Teaser Text: Child Sexual Exploitation (CSE) has been identified as a key concern in the United Kingdom. In recent years, cases of organised CSE have been identified in an increasing number of towns and cities, including Derby, Rochdale, Rotherham, Oxford, Swansea and Telford. The extent and the widespread nature of such abuse has caused public anger and concern, with Special Case Reviews revealing institutional neglect by social workers, local councils and the police service. In a context of increasing political and media focus on the failings in these cases - and consideration of which measures might have been deployed to prevent harm - this article seeks to illuminate the work conducted by a team of CSE

1
2
3 safeguarding practitioners involved in the delivery of a CSE education awareness program to
4 young people. In particular, we show how both perceptions and decisions made by practitioners
5 are influenced by both professional guidelines and more subjective cultural values.
6
7
8
9

10 **Introduction**

11
12 In this article, we focus on the perceptions of practitioners involved in delivering educative
13 programmes designed to raise awareness amongst young people about the risks of Child Sexual
14 Exploitation (CSE). Drawing on a qualitative study, we explore how practitioners' perceptions
15 are conditioned not only by professional codes and modes of risk assessment, but also by
16 cultural values and attitudes toward gender, childhood and sexuality. We seek to illumine the
17 ways in which personal assumptions influence the professional conduct of practitioners in
18 terms of monitoring, risk assessment and intervention. Insofar as it is important to be sensitive
19 to the difficulties faced by professionals involved in safeguarding, draw attention to the
20 connections between societal gendered assumptions - more explicitly the difference between
21 what constitutes acceptable as opposed to 'risky' behaviour for boys and girls - and how these
22 assumptions impact on the process of risk assessment for practitioners supporting young
23 people. Using empirical data, we aver that a concentrated focus on the activities of girls and
24 young women in particular - relating to self-presentation, body weight, use of make-up,
25 sartorial choices, relationships and friendship groups - may lead to the magnification of
26 anxieties that transcend the ambit of professional modes of assessment. Aside from the
27 implications of this for assessment frameworks designed to identify vulnerability to CSE, we
28 also consider the potentially iatrogenic effects of risk-based decision-making for young people
29 impacted by interventions. If subjective culturally conditioned assumptions about gender are
30 impacting on the ways in which practitioners involved in safeguarding young people from CSE
31 make decisions about safety and safeguarding, it is important to raise questions about how
32 these assumptions may structure and orient the nature of work that they are doing. Our

19 **Context Setting: Addressing the Problem of Child Sexual Exploitation**

20
21 In recent years, the extent of the problem of CSE in Britain has been illuminated by cases of
22
23 organised abuse across the country in a range of locales, including Derby, Rochdale,
24
25 Rotherham, Oxford, Swansea and Telford. Public exposure of these cases has highlighted the
26
27 scale of the problem of CSE whilst revealing the shortcomings of various institutions and
28
29 agencies involved in child protection. In Rochdale, the Special Case Review (SCR) reported
30
31 that the severity of the problem of child sexual abuse was strikingly under-acknowledged by
32
33 senior managers working within child welfare and social care (Easton, 2020). Further, at an
34
35 operational level, the police service dismissed complaints made by young people without
36
37 sufficient investigative diligence and of failing to treat the abuse that victims suffered as
38
39 criminal offences. Other SCRs have identified similar problems, criticising practitioners'
40
41 misperceptions of young people's behaviour and flaws in the strategic decision-making of
42
43 senior officials. In Oxford, the SCR reported misunderstandings among professionals about
44
45 what constitutes consent affected decisions about whether to refer and also how referrals were
46
47 assessed, with 'earlier sexualisation of children, the age of perceived self-determination and
48
49 ability to consent creeping lower' (Bedford, 2015: 105) making it more difficult for
50
51 professionals to intervene. In Telford, both the police service and social workers responsible
52
53
54
55
56
57
58
59
60

1
2
3 for safeguarding children admitted failures to take 'seriously enough' the sexual exploitation
4 of young people (Cobain, 2018: 4).
5
6
7
8
9

10 These cases make clear that assumptions about children and their sexual behaviour has, at best,
11 clouded social worker and police judgment and, in the worst instances, led to neglect of
12 professional duty. Research conducted by organisations supporting parents and carers of
13 children impacted by CSE - such as Parents Against Child Exploitation (PACE) - raises further
14 concerns about interactions between social care workers and parents of exploited children. In
15 a study involving 32 parents (Pike et al., 2019), virtually all of the participants said that they
16 felt that social workers had an inadequate understanding of the nature of child sexual
17 exploitation. The study also reports that parents/carers of abused children felt social workers
18 frequently minimised or dismissed the physical and mental harm their children were being
19 subjected to by abusers. A long list of issues and grievances were raised by participants,
20 including lengthy delays prior to intervention; concerns about not being properly listened to by
21 social workers; a lack of emotional and practical support for children and a negative climate of
22 suspicion towards parents (see Pike et al., 2019).

40
41

42 Disquiet about the impact of discourses around the normative sexual behaviour of young
43 people have not been limited to those working with exploited children. Prevention and early
44 intervention activities involving discussions with youth about their sexual behaviour have been
45 criticised for attending exclusively to potential dangers associated with teenage sex and for
46 defining 'normal' teenage sex as heterosexual and coital (see Bay-Cheng, 2010). Further,
47 recognition of young people's experimentation around sexual pleasure - and acknowledgement
48 of their desire for shared intimacy - is often strikingly absent from sexual health promotion
49 literature (see Beasley, 2008; Byron, 2016). As Bourke (2019: 1) suggests, the very intimation
50
51
52
53
54
55
56
57
58
59
60

1
2
3 that children or young people ‘might assert sexual agency elicits fear - if not outright panic -
4 in most adults’. In addition to ‘troubling’ the sexual preferences of young people, parents and
5 guardians have, in Western countries, been exhorted by the State, politicians and the media to
6 monitor and survey children’s activities (Angelides, 2019). Furedi (2018) posits that a
7 pervasive ‘culture of fear’ has been institutionally cultivated around the vulnerability of
8 children, promoting forms of ‘paranoid parenting’.

19 Historically, anxieties about young people’s sexual behaviour can be understood within the
20 broader context of general perceptions of the unruliness of young people projected by elder
21 generations. Concerns about reckless and feckless youth have been a prominent feature of
22 British society for several hundred years. As Pearson (1983) observes, ‘respectable fears’ have
23 historically been reproduced via a process of looking back through rose-tinted spectacles to an
24 era of innocence and safety, contrasted with a contemporary age marked by risk and insecurity.

32
33
34

35 In 2017, in an attempt to circumvent accusations of victim-blaming, the UK Department of
36 Health shifted its definition of young victims from ‘children involved in prostitution’ to a more
37 offender-centred interpretation that acknowledges that CSE is as an organised form of abuse:
38
39
40
41
42
43
44

45 It occurs where an individual or group takes advantage of an imbalance of power
46 to coerce, manipulate or deceive a child or young person under the age of 18 into
47 sexual activity (a) in exchange for something the victim needs or wants and/or (b)
48 for the financial advantage or increased status of the perpetrator or facilitator. The
49 victim may have been sexually exploited even if the sexual activity appears
50 consensual. Child sexual exploitation does not always involve physical contact; it
51 can also occur through the use of online activity (Department for Education, 2017:
52
53
54
55
56
57
58
59
60

2
3 5).
4
5
6
7

8 Post high-profile enquiries outlining systematic institutional failings and a culture of denial
9
10 (Jay, 2014; Coffey, 2014), CSE became designated as a strategic led by the police service, with
11
12 forces across England and Wales having a duty to collaborate across county lines to safeguard
13
14 children. The National CSE Action Plan (2014) - written by the Association of Chief Police
15
16 Officer's (ACPO) and supported by the College of Policing - states that awareness should be
17
18 raised amongst young people, parents, carers and potential perpetrators. The publication of this
19
20 plan triggered a range of initiatives oriented toward prevention through early intervention. One
21
22 such initiative was that implemented by a police force area, referred to hereafter as Midshire.
23
24 The aim of this police-led intervention was to encourage young people to reflect on and, where
25
26 appropriate, modify their behaviours in order to enhance safety and decrease risk of exposure
27
28 to CSE. A range of tools and techniques were used by practitioners to inform young people
29
30 about effective modes of self-regulation and ways of preventing harm. The two headline
31
32 messages communicated to young people were to be cautious of strangers that make
33
34 approaches online and to avoid sharing graphic images with partners, peers or strangers.
35
36 Although the exact content of the awareness raising sessions differed in accordance with the
37
38 demographic of the audience, a common framework was followed. Each presentation opened
39
40 with a warning that possession or sharing of an indecent image by a young person was illegal
41
42 and that those possessing and/or or distributing such images were committing a criminal
43
44 offence. Emphasis on deterrence was reinforced by identification of various social media sites,
45
46 accompanied by a caveat that such sites can be dangerous if used inappropriately. Practitioners
47
48 impressed on young people the risks involved in sharing personal details and images on social
49
50 media. In particular, the opportunities that such platforms afford for perpetrators of CSE to
51
52 befriend and exploit young people were underlined. A short film was then screened, involving
53
54
55
56
57
58
59
60

1
2
3 a real-life case of a young person subjected to exploitation. The film most frequently shown in
4 the education awareness training was 'Kayleigh's Love Story' This film focuses on a young
5 girl who 'friended' a stranger that approached her on Facebook. She exchanged 2,643 messages
6 with him over a two-week period and subsequently agreed to meet him at his home.
7 Unbeknown to Kayleigh, the man had invited his neighbour to join them. On arrival she was
8 plied with alcohol and both men sexually assaulted her. As Kayleigh tried to escape, she was
9 seized by the neighbour, who raped and murdered her. This shocking case was used by
10 practitioners to invite the audience to reflect on the perils of social media and the need to be
11 vigilant when approached by strangers online. Instructions were given about managing online
12 behaviour to avoid becoming vulnerable to sexual predators. The approach adopted by
13 practitioners was strongly oriented toward harm reduction through preventative risk focussed
14 educational methods. While consistent with government directives and indubitably well
15 intentioned, a pronounced focus on deterrence - via encouragement to self-monitor, regulate
16 behaviour and be mindful of strangers - was not roundly accepted, nor well received by the
17 audience (see Weston and Mythen, 2020). To explore further some of the reasons for this lack
18 of engagement, we focus on the perceptions of practitioners involved in delivery of the
19 initiative. Specifically, we show that cultural values and subjective attitudes towards gender,
20 childhood and sexuality continue to influence both risk-based practices and intervention
21 decisions.

Study Design and Methods: Evaluating a CSE Intervention

22 Before relating the context described above to the ways in which CSE prevention initiatives
23 are designed and implemented, it is necessary to convey the key objectives of the study. The
24 findings discussed below are drawn from a qualitative study designed to evaluate the
25 effectiveness of an initiative implemented by Midshire police force. Semi-structured interviews

7 [INSERT FIGURE 1 HERE]
8
9

10 In our analysis we focus exclusively on the semi-structured interviews with the multi-agency
11 team and strategic leads that devised and implemented the programme and the referral forms
12 subsequently completed. Two stage interviews canvassed the perspectives of 17 practitioners
13 from varying backgrounds involved in delivering the programme. Included within this sample
14 were nine members of the delivery team and eight members of the steering group. The team
15 was co-located within Midshire police's CSE team and comprised experienced practitioners
16 embedded within child/youth welfare-oriented positions, including police officers with 12-25
17 years' service, a family support worker previously employed by the local authority, a
18 residential care support worker, a teacher, a youth worker and a voluntary sector worker,
19 previously supporting children at risk of CSE. With the exception of one participant was aged
20 and who had four years experience of working within the sector - practitioners who were not
21 police officers had between 13-24 years previous experience and were aged 30-45 years.
22 Members of the steering group were similarly diverse, representing senior police chiefs, county
23 and city-wide safeguarding leads and a commissioner for children's services. In order to enable
24 maturation of perspectives - all participants were initially interviewed within six months of the
25 programme's implementation and in follow up interviews 12 months later. Interviews lasted
26 between 45-90 minutes, following a semi-structured topic guide about the CSE initiative and
27 reflections on the participant's role within it. Interviews were conducted at the offices of the
28 interviewer or the interviewees.
29

44
45
46
47
48
49
50
51
52

53 Access to young people participating in the CSE awareness raising initiative was granted
54 through the consent of three secondary schools across Midshire. Within these schools, field
55 observations of the team delivering the education awareness programme were conducted,
56
57
58
59
60

1
2
3 followed by focus groups with young people participating. Four focus groups were carried out
4
5 with 43 young people aged 15-18. These took place at the participants' educational facility and
6
7 lasted between 45-60 minutes. Informed consent was given by all participants involved in the
8
9 study. The research adhered to the British Sociological Association's ethical protocol and
10
11 received approval by the University's Ethics Committee
12
13

14
15
16
17 Interviews and focus groups were recorded and transcribed post data gathering. The principles
18
19 of grounded theory were followed throughout the process of data analysis (Glaser and Strauss,
20
21 1967). Given our commitment to learning from participants and growing ideas and concepts
22
23 from the 'bottom-up', grounded theory was deemed to be the most suitable approach to follow
24
25 (Strauss and Corbin, 1990). During transcription, researchers became familiar with the data set
26
27 and went on to identify emergent patterns and themes. During preliminary analysis, initial open
28
29 codes followed by axial codes were attached to interview and focus group transcriptions in
30
31 order to advance the coding framework. The researchers subsequently convened to discuss and
32
33 agree key themes and sub themes. In the second phase of systematic analysis, interview and
34
35 focus group transcripts were distributed amongst the research team for analysis along with the
36
37 agreed coding framework to ensure consistency. Following the principles of grounded theory,
38
39 axial encoding was conducted during both the preliminary and systematic phases of analysis,
40
41 enabling iterative and dynamic evaluation. It should be noted that the findings related below
42
43 derive from a small-scale geographically specific study and are thus not generalisable.
44
45 Nevertheless, we surmise that the issues highlighted may chime with the conundrums and
46
47 dilemmas faced by social work practitioners engaging with young people across a range of
48
49 contexts.
50
51
52
53
54
55
56
57
58
59
60

1
2
3 In the following discussion, we analyse data from interviews with practitioners and extracts
4 from referral forms. Drawing on illustrative vignettes, we illuminate two intersecting issues
5 that emerged through concurrence during the process of data analysis: the gendering of risk
6 and anxieties about young people's sexuality. Alongside recourse to established risk
7 frameworks, these processes informed practitioner perceptions, decision-making and
8 intervention judgments.
9
10
11
12
13
14
15
16
17
18

19 **Values, Assumptions and Presumptions: Gendering Risk?**

20
21
22 Interview analysis indicates that practitioners from different professional contexts had similar
23 understandings of suitable/inappropriate forms of activity for young people. Some of these
24 ideas related to age, while others focussed specifically on sexual conduct:
25
26
27
28

29
30 I think it can be a fine line sometimes, depending on what the age gap is like. We
31 spoke to a girl the other day - she was 14 and she'd been seeing a 17-year-old -
32 and she didn't think she was doing anything wrong. So, we sort of had to say, you
33 know, he's nearly 18, you've known him 12 months and you would have been 13
34 when you first met him. That isn't really what we would say is an appropriate
35 relationship. So, you sort of try and educate them that a 17 - nearly 18-year-old
36 - male shouldn't really be interested in somebody of that age. So, although they
37 might not be being exploited, we would go down this sort of healthy relationship
38 type of route (Amanda, Prevent CSE Worker, previously police officer).
39
40
41
42
43
44
45
46
47
48
49

50
51 I think for a long time we looked at exploitation and said is it because of potential
52 gain? - It can be financial or monetary - but I don't think kids are actually doing
53 it for that. I think it's a bit of a misconception. They might have got some gifts,
54 or some alcohol, but the thing we're dealing with now, in *Prevent* we're seeing,
55 it's more just kids growing up and misunderstanding what's appropriate and what
56
57
58
59
60

1
2
3 kind of sexual activity is appropriate and normal (Mark, Prevent CSE team leader,
4
5 previously police officer).
6
7

8 While Amanda cites an example where an educative approach may have utility in inappropriate
9
10 age gap relationships, Mark flags comprehension of stages of sexual and ideational maturation
11
12 as critical in supporting young people in making safe decisions.
13
14

15 In addition to age, a recurrent pattern prevalent amongst practitioners related to distinct sets of
16
17 gendered attitudes and expectations:
18
19

20
21 I've worked with a couple of young girls who absolutely have got no interest in
22
23 their friends when the boyfriend's there. And he's their world, he's the one thing
24
25 they concentrate on. I was always worried about that. Like, what's happened?
26
27 Where have your friends gone? And I think that's not how it should work.
28
29 Because ultimately, he's isolated you already, whether you meant to or not,
30
31 you've isolated yourself in a way (Susan, Prevent CSE Worker).
32
33
34

35 In addition to guarding against the risks of becoming isolated from familial and friendship
36
37 networks, practitioners such as Clare indicated that young females should be more cautious
38
39 and adhere to socially acceptable sexual behaviours:
40
41

42
43 I think girls generally have lower morals. I think that they have little self-
44
45 confidence. I think that they have little worth of themselves. And I say girls, I'm
46
47 not generalizing, obviously, all girls, but we've got particularly vulnerable girls
48
49 here who are easy and who are targets for these people who want to groom them
50
51 (Clare, Prevent CSE worker, previously family support worker).
52
53

54 Clare's suggestion that 'vulnerable girls' are 'easy' and have 'lower morals' is mirrored in the
55
56 way that young people are educated about CSE, with sharp lines being drawn between 'healthy'
57
58 and 'unhealthy' relationships:
59
60

1
2
3 I suppose in our presentations, we are teaching young people how to identify a
4 healthy relationship, a positive one. So we talk about things like having sex,
5 watching porn, talking about sexual things ... and we just explain the fact that it
6 doesn't matter who that person is that's trying to get you to do that, whether or
7 not it's a friend or a boyfriend or a girlfriend or a stranger, at the end of the day,
8 that's not really what should be expected of you (Cathy, Prevent CSE worker).
9
10
11
12
13
14
15
16
17
18

19 Like Susan, Cathy's perspective suggest that girls may lack agency and autonomy, while 'boys'
20 seek to take advantage by either tactics of isolation in Susan's example, or manipulation in
21 Cathy's. Other practitioners were of the view that girls were becoming inured to behaving in
22 ways that primarily served to satisfy the sexual and domestic proclivities of boys/men:
23
24
25
26
27
28

29 As part of my old role, I was going to some of the youth clubs. I could see the
30 relationships. Boys had so little respect for girls. Girls were expected to listen and
31 obey, that's definitely where the world is heading these days. That's actually
32 what's expected of a relationship now. Boys tell you what to do, and you do it. As
33 a female - you do what a man says. When a man comes home, you have his tea on
34 the table. If a man says he wants sex, you give it to him, even if you don't want to.
35
36
37
38
39
40
41
42
43 And I think that's not how it should work. (Clare, Prevent CSE worker, previously
44 family support worker).
45
46
47

48 While there is much to unravel here in relation to gendered societal norms and the socialisation
49 of young people, Clare's comments are underpinned by concern about the normalisation of a
50 patriarchal culture in which male power is valorised and women are rendered subordinate.
51
52
53
54 Notwithstanding rentrenchment of patriarchal culture in contemporary society (see Off *et al.*,
55 2022), what is absent here is recognition that young women, like young men, may be - to
56
57
58
59
60 greater or lesser degrees - making self-determined choices regarding their sexual preferences

1
2
3 and relationship choices. Whilst patriarchy remains systemically embedded (Abraham, 2019;
4
5 Pierek, 2022), there are dangers in adopting a general position on sexual relationships that casts
6
7 calculating boys and men as preying on naïve and vulnerable girls. Aside from under-
8
9 emphasising capacity for agency and reflexivity, the categorical assumptions made in situating
10
11 males as manipulators of young females, elides that boys and young men can themselves be
12
13 victims of CSE, whether at the hands of female or male abusers. As Thomas (2021) posits, not
14
15 only do boys experience sexual trauma and difficulties, the ways in which these may manifest
16
17 behaviourally in everyday life can lead to them being dismissed unruly or ‘troublesome’
18
19 behaviour. Whilst the majority of instances of CSE in the UK are instigated by adult males,
20
21 drawing blanket gendered assumptions about the motivations of boys/men and girls/women
22
23 runs the risk of heteronormative thinking, accelerating ‘false positive’ cases and overlooking
24
25 cases where males are victims.
26

Reflecting on Sex, Morality and Risk: The Surfacing of Respectable Fears?

34
35 The perceptions of risk articulated by practitioners above raise prescient issues around the
36
37 relative balance between professional and personal perspectives and the ways in which this
38
39 feeds into decision-making regarding the circumstances in which a CSE intervention is
40
41 necessary. It is understandable that practitioners working in this context are inclined toward
42
43 loading the balance of risk toward precaution, with safeguarding priorities often trumping
44
45 potentially damaging effects of an intervention on relationships between involved parties. The
46
47 precarities associated with balancing these competing priorities is recounted by Debbie after
48
49 one of the awareness raising sessions:
50
51

52
53 She is 14 and her boyfriend is 17, so that’s one factor that’s concerning. We don’t
54
55 know who the young lad is, he’s not known. It could be a legitimate relationship.
56
57 The fact that she’s got no friends, that puts her at risk. The fact that - she has told
58
59
60

1
2
3 me today - that she's speaking to people on Facebook she doesn't know, that's
4 putting her at risk. So, by spending this time with her she's actually telling me a lot
5 more. For me, I think it's better to do it that way. So that's why I think this is the
6 best way to do it. Because if I went out for an hour, like maybe the police are used
7 to, she wouldn't want to speak to me (Debbie, Prevent CSE worker, previously
8 voluntary sector CSE worker).
9

10 The example shared above is illustrative of the value of awareness building initiatives, in terms
11 of proactive information gathering and counselling young people. Yet there are also thorny
12 issues to consider when specific risk factors - such as social isolation - are deployed in
13 decision-making about whether and how to intervene, in circumstances in which practices that
14 might otherwise be considered mundane, such as messaging on Facebook, are flagged as risky
15 for young people. Indeed, the assessments recorded by practitioners on referral forms (RF)
16 specifically included, 'seeming to be more involved with social media than direct contact with
17 family and friends', as a risk indicator (RF4). Risk evaluations typically identified heightened
18 concerns about a young person's use of electronic devices: 'observed by Foster carer, who
19 states that [young person] spends lots of time on her laptop. Foster carer supervises this, but
20 [young person] does not seem to understand how much time she is spending on the laptop'
21 (RF1).
22
23
24
25
26
27
28
29
30
31
32
33
34
35
36
37
38
39
40
41
42
43
44

45 Thus, various risk indicators - such as relationship age gaps, unknown partners, friendlessness,
46 internet use and social media messaging - were used as codas and aggregated into risk profiles
47 that, in turn, informed decision-making regarding further monitoring and/or precautionary
48 intervention. While professional codes steer these processes for practitioners, otherwise
49 unremarkable activities can become rendered suspicious. As the comments in RF1 suggest,
50 frequent computer usage is considered as a red flag to be actively policed and investigated.
51 Other referrals made direct reference to particular social media sites: '[Young person] has
52
53
54
55
56
57
58
59
60

1
2
3 recently requested that she open a Facebook account, but has been advised not to do this by
4 myself in order to ensure that [young person] is protected from the dangers of social media.
5
6 [Young person] can be very over familiar with strangers and is likely to engage with online
7
8 friendships and not understand the risk of this' (RF6).
9
10

11
12 Of course, it is not possible to judge individual levels of vulnerability extracted from context,
13 nor to speculate on proficiency in internet safety. Nevertheless, referral forms frequently
14 expressed concern about lack of awareness of online risks. Self-presentation of girls and young
15 women was also often documented as a cause for concern. Some safeguarding referrals
16 included explicitly problematic gendered references to clothing preferences and physical
17 attributes, such as the person concerned 'wearing skimpy clothes' and 'being an attractive
18 young lady with a great figure' (RF3). These examples are troubling and bring to the surface
19 the role of subjective factors in the risk assessment process.
20
21

22
23 It is clear that there are instances and grounds where intervention on the basis of prevention of
24 harm is incontrovertibly warranted:
25
26

27
28 I mean we had a girl who was 13 who had met someone online who's 21. We had
29 to go back two or three times to explain that that is not right. A 21-year-old should
30 not be interested in a 13-year-old and although he wasn't doing any ... you know
31 ... wasn't showering her with gifts, wasn't showering her with affection. He
32 believed that, you know, that he was her boyfriend and that was it, and it was only
33 down to the parents taking the iPad and everything off her. That meant saying,
34 this isn't right. He was saying things to her, like that he was - he'd got a child
35 already by somebody else - but you know, I want you to be their mum and so it
36 was all very, yes, not great. But to try and get that across to a young 13-year-old
37 who thinks "Oh I love him". It is difficult sometimes to get that message across
38 to young people (Amanda, Prevent CSE worker, previously a police officer).

1
2
3 The challenging nature of managing emotions and young people's mental wellbeing in the
4 process of safeguarding is writ large above. This case - involving manipulation of a younger
5 female by an elder male - was the principal pattern of abuse discussed by practitioners in
6 awareness raising sessions. In contrast, cases of 'peer-to-peer' exploitation were referred to
7 rarely and mentioned in relation to cascade cases, where peer grooming operated as an
8 'entrance opportunity' for elder male abusers:
9
10
11
12
13
14
15
16

17
18 If you try and identify a perpetrator, obviously you've got the classic signs of if
19 he's 30 and the child is 12, that's your obvious one. But for the peer-to-peer, that's
20 harder. Because unless you're working within them young people as, like, support
21 workers or youth workers, you can't see day-to-day what's going on. So that would
22 be harder to spot out in the community. So, the matching age, so they could be used
23 as the ... so they might be friends with someone the same age, but actually the
24 other young person's also being groomed by someone older and they're being used
25 to bring more people into the situation. So that's when it's peer-to-peer' (Debbie,
26 Prevent CSE worker, previously voluntary sector CSE worker).
27
28
29
30
31
32
33
34
35
36
37
38

39 In follow-up interviews, practitioners were asked to reflect on the types of referrals they had
40 been receiving. As can be seen in the data below, notions of 'appropriate' versus
41 'inappropriate' behaviour informed the referral process:
42
43
44
45

46 I've had quite a few referrals that have been made via professionals who have
47 gone out and done inputs where they want us to work with young people,
48 wherever it be. Sometimes there've not been appropriate referrals to our team,
49 and we've just referred them on to someone else, because sometimes it has just
50 been like over-sexualised behaviour which isn't child sexual exploitation as per
51 the definition. So, I've referred them on to, say, the NSPCC. They do a specific
52
53
54
55
56
57
58
59
60

1
2
3 program about over-sexualised behaviour, where I've had some instances where
4 young people have been referred in because they are talking very inappropriate,
5 but they've not sent any images, they've not received any. They've not been
6 exploited, not been groomed and they've not done that to anyone else. So, it's
7 just about explaining to the referrer that actually we are here as a service for CSE,
8 and the over-sexualised behaviour can go to someone else' (Sadia, Prevent CSE
9 worker, previously police officer).

10
11 I had an email from a lecturer at [redacted] University a couple of weeks ago
12 asking if I could go in and have a discussion with the Freshers, because she'd
13 identified that they're all getting absolutely hammered having these house parties
14 and sleeping with each other. And they haven't a clue who is going to the house
15 party and if they're underage and they're all just sleeping together. Their attitudes
16 to life ... it isn't just about having fun. They just don't think about the careers
17 that they potentially want to go on to and how they could ruin it (Carol, Prevent
18 CSE worker, previously children's residential care worker).

Aside from moral tone and inherent conjecture, these observations are poignant in terms of
perceived differences between 'over-sexualised behaviour' and CSE in the first example, and
porosity between the two in the second. Obviously, in instances where the actions of a young
person render them vulnerable to CSE, monitoring and/or intervention is sagacious. Further, it
is important to be aware of the ways in which normalisation of underage sex potentially exposes
children and young people to the risk of sexual exploitation (Beesley, 2018). Nevertheless, for
some safeguarding practitioners, fears about lax values and 'promiscuous' behaviours keyed
in with a broader sense of contemporary moral decay, typified by young people's perceived
decadence around sex and relationships. Moreover, as in the narratives presented above, the
subject/object of fear is invariably female. Our discussion raises a cluster of barbed issues

1
2
3 around expert perceptions of risk, the complexities involved in decision-making in
4 safeguarding environments where the magnitude of harm is high and effective ways of
5 reducing young people's vulnerability to exploitation. In this context, the balance between
6 educating males around sexual rights, gender equality and respect for women and warning
7 females of the dangers of inappropriate modes of conduct appears uneven. Mirroring Phillips'
8 (2019) analysis of CSRs, what is of interest and import is the way in which young people are
9 'made-up' via the professional production of knowledge and discourses regarding their
10 identities, habits and proclivities.

24 **Discussion**

25
26
27 In this article we have elucidated two interconnected processes observable amongst
28 practitioners involved in the study: first, the gendering of risk, and, second, moral anxieties
29 about young people's sexual behaviour. In relation to the latter, we have raised concerns about
30 a concentrated focus amongst practitioners on the (in)appropriate behaviour of girls and young
31 women. We have excavated some of the problems and challenges that arise in making what
32 are ostensibly risk-based judgements, but connected to gendered assumptions and perceptions
33 regarding acceptable behaviour. While we have focussed on the commingling of fears with
34 formal risk criteria in decision-making around referral and intervention, we wish to end by
35 drawing out the wider implications of our discussion for both agencies involved in
36 safeguarding in this area and future policy focussed research.
37
38
39
40
41
42
43
44
45
46
47
48
49

50
51 As the testimonies of practitioners illustrate, working within the child safeguarding and
52 protection space is highly demanding. Recent cases of organised sexual abuse have placed
53 practitioners under intense scrutiny. Regrettably, abuse continues to occur across various
54 domains, including within sports, residential care, education and religious institutions. Further,
55 there is growing recognition of the diverse forms of CSE - including peer-to-peer - that exist
56
57
58
59
60

1
2
3 alongside sexual abuse perpetrated by adults on children and young people (see Allardyce and
4 Yates, 2018; Hackett, 2016). For safeguarding practitioners operating at permeable interfaces
5
6 - within social work, welfare, schools, healthcare settings and youth justice - both
7
8 acknowledging this shift and being alert to changing patterns of CSE - is crucial in adapting
9
10 modes of professional risk assessment and, where necessary, developing fresh analytical tools
11
12 to keep pace with a fluctuating world in which the habits and activities of young people are
13
14 constantly in transition.
15
16
17
18
19
20

21 We have argued that, despite recourse to risk-based modes of evaluation, decisions that feed
22
23 into future monitoring and/or interventions cannot readily be separated from cultural values
24
25 and moral concerns about young people's sexual behaviour and choices. Although it is widely
26
27 acknowledged that various factors such as poverty, family conflict, homelessness, an unsettled
28
29 care history and/or episodes of running away from home, homelessness, learning and mental
30
31 health difficulties and drug and alcohol abuse, are likely to increase the risk of exploitation (see
32
33 Berelowitz, et al. 2013; Chase and Statham, 2005; Harris and Robinson, 2007), young people
34
35 without these indicative vulnerabilities were also identified as at risk, whether it be through
36
37 frequent computer and internet use, social media and shared gaming platform activity and
38
39 clothing choices. It is expectable that awareness raising programs focussing on CSE should
40
41 highlight risks and provide advice on safety techniques. Nevertheless, attending only to the
42
43 potential dangers and harms associated with (teenage) sexual practices mutes acknowledging
44
45 the young people's desires to explore their sexuality, whether that be through performative
46
47 expression, self-presentation or shared intimacy. Whilst there may be other educative forums
48
49 in which such conversations are enabled, when risk-based approaches are applied in areas of
50
51 sexual health, pleasure and fulfilment are considered as antithetical to safety (see Lee and
52
53 Crofts, 2015).
54
55
56
57
58
59
60

1
2
3
4
5
6 Our analysis resonates with research on how practitioners identify and work with children that
7
8 may be at risk or engaged in harmful sexual behaviour, in contexts where they may not always
9
10 equipped with the knowledge, skills and confidence required (Clements, et al. 2017). Whilst
11
12 our findings align in this regard, it has been our intention to move debates on to consider the
13
14 ostensibly 'extraneous' factors that might influence decision-making and professional
15
16 practices. The data from our study indicates that - in addition to formal risk assessment
17
18 guidelines and tacit professional knowledge - when practitioners make decisions, they also
19
20 draw on implicit and culturally conditioned assumptions about gender and sexuality. There is
21
22 a need, therefore, for practitioners to be supported in reflecting on and considering their own
23
24 frames of understanding, how these play out in practice, and the implications of this for
25
26 safeguarding procedures. In addition to engaging at a deep level with the contextual lives of
27
28 children and young people, resources and time for reflection on the dynamic cultural, social
29
30 and political landscape within which practitioners operate is required, alongside recognition of
31
32 the extent to which this context impacts routine knowledge and professional practices.
33
34
35
36
37
38
39

40 **Conclusion**

41
42 In this paper, we have illuminated some of the problems and issues faced by practitioners when
43
44 identifying young people at risk of child sexual exploitation. With regards to expanding
45
46 academic knowledge, there is a need to develop a more in-depth understanding of the effects
47
48 of various factors that may influence risk decision-making and how these shape professional
49
50 practice. Developing knowledge about the ways in which CSE prevention is enacted and
51
52 implemented across different international contexts, may afford not only identification of
53
54 commonalities and differences but also, where appropriate, importing of innovative and
55
56 valuable practices. Recognition that safeguarding decisions are influenced by practitioners'
57
58
59
60

1
2
3 knowledge and experience (Clements et al. 2017), confidence and emotions (Banks, 2002) and
4 attitudes, values and beliefs (Wilks, 2004), has led to calls for reflective practice to be
5 embedded across organisations and agencies that have a role in identifying risk (Berelowitz, et
6 al. 2013; Reisel, 2017; Weston and Mythen, 2021).. We have shown that practitioners making
7 decisions in this particular safeguarding context, do so amidst the presence of ‘respectable
8 fears’ about young people’s behaviour and anxieties about their sexual proclivities, which may
9 tip the balance of risk too heavily toward precaution and delimit the agency of young people
10 in their sexual behaviour and relationship choices.. As such, those supporting young people
11 should appreciate that they, like adults, are sexual agents and not simply ‘passive recipients of
12 the adult sexualised gaze’ (Bourke, 2019: 1). To fail to approach young people at risk of CSE
13 as ‘active agents’ may compound feelings of powerlessness, trauma and neglect (Hallet, 2016).
14 It is evident that successfully engaging young people about the dangers of CSE is contingent
15 on the establishment of solid trusting relationships to enable them to explore behaviours,
16 interactions and situations (Lefevre et al., 2017). To encourage these institutionally embedded
17 spaces and places - are required to facilitate frank and open conversations, geared toward
18 empowering teenagers and encouraging them to develop responsible strategies to keep safe.

40
41

42 In a wider context within which multi-agency approaches to crime prevention are becoming
43 increasingly popular our findings are prescient. As child protection services evolve and
44 restructure to include an assortment of agencies, both the benefits and the shortcomings of such
45 partnerships need to be continually evaluated. Although multi-agency approaches to child
46 welfare and safeguarding promise multiple benefits, within organisations not traditionally
47 aligned to social work, appropriate skills training is needed to equip practitioners to operate
48 effectively in sensitive safeguarding spaces. Encouraging professional reflection and dialogue,
49 alongside listening to the needs and experiences of young people, is necessary in order not only
50
51
