Description

interbedded thin turbidite sands with suspension carbonaceous and micaceous deposited silts and muds. flute casts common on the base of sand sheets, laterally consistent loading cast sheets on the base of sandstones

massive sandstone, turbidite transported with deformation in basal 1.5 metres, possibly slumping shortly after deposition

parallel laminated silts, dominantly suspension dominated, rare groove casts and small flute marks, discrete bioturbation

well laminated to massive grey mudstone

black mudstone with ammonoid fauna, rare papery lamination associated with maximum ammonoid density

black micaceous muds, with papery lamination, plant debris

?cross bedded sandstone
