Description

parallel bedded sandstone, coarsening upwards, deposited from suspension

parallel laminated interbedded siltstone and sandstone, implying deposition from suspension, regularity of cm scale coarsening upwards units may infer cyclicity in fluvial supply source, two beds of massive coarser grained sandstone inferred as possible fluvial driven turbiditic sands

black parallel laminated mudstone, isolated ammonoids, ammonoid rich horizon weathered to sulphurous orange pliable clay

parallel laminated, deposited from suspension, regular coarsening upwards pattern of units suggest clastic input close to point source

parallel laminated silty mudstone to siltsrone deposited from suspension
