Description

(c) Matt Brettle 2001

dominant deposited from suspension with brief fluxes of tractionally transported sediment

sporadic deposition of vfs from suspension, poss periodic plume encroachment, app no effect of bioturbation

mic gy silts, partly covered in scree

silty muds, laminations appear continuous

mid gy, sulphurous horizons, slightly silty throughout

v blk muds, more mass nature, orange clays

small sulphurous nodules

blk muds, sulphurous, slightly mic, poor preserved ammonoids and Dunbarella

leached white, with carb films sub horizontal orientation possible partly affected by pedogenic processes
